END OF SEARCH HISTORY

field is being generated, irradiating said earth formation with a radio frequency radiation that is preferentially absorbed by electrons in free radicals of said hydrocarbon molecules in said weak polarizing field to enhance polarization of protons of hydrocarbon molecules within said earth formation, said irradiating field being aligned substantially normal to said weak polarizing magnetic field, (e) interrupting both said weak polarizing magnetic field and said irradiating magnetic field to initiate precession of protons polarized by said polarizing and enhancing fields, (d) and detecting signals induced by said precessing protons of said hydrocarbon molecules precessing in the earth's magnetic field. 3. A nuclear magnetism well logging method for identifying the presence of hydrocarbon molecules in an earth formation from within a well bore penetrating said earth formation comprising the steps of: 30 (a) establishing within said earth formation a weak polarizing magnetic field having at least a component thereof perpendicular to the earth's magnetic field, said polarizing field being of the order of about 5 gauss at the interface between said well bore and said earth formation (b) simultaneously establishing a radio frequency irradiation within said well bore and earth formation, said irradiation frequency being within the range of 2 to 30 megacycles, 40 (c) interrupting said polarizing magnetic field and said irradiating magnetic field to initiate precession of polarized protons in the earth's magnetic field, (d) and detecting signals induced by said precessing protons of said hydrocarbon molecules in the earth's magnetic field.
